Abstract of the Disclosure

A driverless direct-printing method between a client computer and a direct-printing-enabled printer. A working relationship for direct printing is established through a set of dynamically configurable modules whose conditions for document native-format

5   direct printing are established from printer data in database structure which has been pre-collected, at least in part, by a printer discovery process. Aside from the presence of a printer discovery module which helps to populate the database structure just mentioned, other configurable modules include a print menu selection module, a job control generation module, a print job construction nodule, and a scheduling/spooling/despooling

10   module.
